Mountain View, CA · junwon3329@gmail.com · linkedin.com/in/junwon3329 · github.com/jw3329

AI agent engineer with 8+ years in backend, payments and reliability. Core contributor to Curie, an open-source platform that runs LLM agents safely in production; former SRE for TikTok's US payment systems.

EXPERIENCE

CurieTech AI — Member of Technical Staff · Sunnyvale, CA June 2025 – Present

- Second-largest contributor to Curie, an open-source agent platform (560+ merged PRs since July 2026), now live with its first production client.
- Built production agents on Curie for its first enterprise client: a quarterly financial reporting agent built on QuickBooks Online data, and a brand marketing agent that generates on-brand images and video.
- Built the SRE co-worker: analyzes real-time alert emails against Kubernetes, Prometheus and Grafana, and posts a diagnosis with suggested fixes in Slack.
- Designed the agent safety model: human approval flows, operator remediation policies, per-stage action receipts, sealed per-connector secrets and one Slack identity per bot.
- Built the "mean tester", an adversarial agent that tries to break other agents and issues a computed ship verdict, plus drift canaries; cut model cost with prompt-cache-safe resume and memory compaction.
- Built much of the Rust curie CLI and Helm deployment: one-file declarative installs, one-command repo onboarding, and git-flow deploy targets.
- Built the MuleSoft AI product end to end: replaced a legacy workflow with a chat-based agent that grew active users, and built agents that migrate integrations between platforms.
- Fully automated Stripe subscription and usage billing with an ops admin console; saved $780/month by removing a cache with a 2.1% hit rate.

TikTok — SRE, Global Payments; Software Engineer, Risk (from Sep 2023) Jan 2023 – June 2025

- On the SRE team that ran TikTok's US payment systems, including on-call.
- Built a config diff service (debugging −70%) and the Project Ticker status dashboard (on-call checks −80%).
- Made chargeback validation 70% faster; ML and rule filters left about 30 cases a day for manual review.
- Built a fraud and chargeback reporting chatbot (manual work −30%) and a risk framework adopted by 12+ engineers.
- Built TikTok Pay front to back, a top-3 internal hackathon project.

Homethrive — Software Engineer Apr 2020 – Jan 2023

- Built a Docker-based CI testing framework (coverage +30%) and automated AWS provisioning with Terraform (provisioning time −90%).
- Built a secure permission-validation API wrapper (development time −95%) and an FCM/APNs push notification service with real-time delivery.

Tata Consultancy Services — Software Engineer Sep 2018 – Apr 2020

- Built automated reporting and Python alerting for the Enterprise Data Hub, saving ~15 hours a month.

PROJECTS

- **Moim** (2025 – present): event app on web, iOS and Android (Next.js, Capacitor, PostgreSQL); 1–2 events a month, 10–20 attendees each.
- **WiseBuy** (2023 – present): cross-country luxury price comparison with about 400 visits a day, SEO and bot defense.
- **Running Club MCP** (2026): Garmin running data as MCP tools for Claude. github.com/jw3329/run-mcp

SKILLS

AI: Claude API, MCP, tool use, agent evals, prompt caching, human-in-the-loop design
Languages: Python, Rust, TypeScript, Go, Java, SQL
Infrastructure: Kubernetes, Helm, AWS, Terraform, Docker, OpenTelemetry, Prometheus, Grafana, PostgreSQL

EDUCATION

University of Illinois Urbana-Champaign — B.S. in Computer Science and Mathematics 2018
