Applied AI engineer with 8+ years in backend, payments and reliability. Owns CurieTech's agent product end to end on Curie, an open-source agent runtime with evals, human approval and guardrails; former TikTok payments SRE.

EXPERIENCE

CurieTech AI — Member of Technical Staff · Sunnyvale, CA — June 2025 – Present

- Own the agent product end to end, from defining client problems to production and client feedback; shipped the first enterprise client's agents for quarterly financial reporting (QuickBooks Online) and on-brand image and video.
- Set technical direction for ~5 product engineers: split work so it ran in parallel, cut overlapping and low-priority tasks, and fixed communication gaps and code-quality issues.
- Created the "mean tester", an adversarial agent that tries to break other agents and issues a computed ship verdict, and added drift canaries that flag quality regressions.
- Designed the agent safety model: human approval flows, operator remediation policies, per-stage action receipts for audit, sealed per-connector secrets and one Slack identity per bot.
- Developed the SRE co-worker, a support agent that triages real-time alert emails against Kubernetes, Prometheus and Grafana and posts a diagnosis with suggested fixes in Slack.
- Second-largest contributor to Curie (560+ merged PRs since July 2026): wrote much of the Rust curie CLI and Helm deployment, and cut model cost with prompt-cache-safe resume and memory compaction.
- Owned the MuleSoft AI product end to end: replaced a legacy workflow with a chat-based agent that grew active users, and delivered agents that migrate integrations between platforms.
- Automated Stripe usage billing; used hit-rate data to remove an unused cache (2.1% hits), saving $780/month.

TikTok — SRE, Global Payments; Software Engineer, Risk (from Sep 2023) — Jan 2023 – June 2025

- Cut chargeback validation time 70% by combining ML and rule filters, leaving ~30 cases a day for human review.
- Launched a fraud/chargeback reporting chatbot (manual work −30%) and a risk framework adopted by 12+ engineers.
- Served on the SRE on-call rotation for TikTok's US payment systems; created a config diff service (debugging −70%) and the Project Ticker status dashboard (on-call checks −80%).

Homethrive — Software Engineer — Apr 2020 – Jan 2023

- Raised test coverage 30% with a Docker-based CI test framework and cut AWS provisioning time 90% with Terraform.
- Cut development time 95% with a secure permission-validation API wrapper; delivered an FCM/APNs push notification service with real-time delivery.

Tata Consultancy Services — Software Engineer — Sep 2018 – Apr 2020

- Automated reporting and Python alerting for the Enterprise Data Hub, saving ~15 hours a month.

PROJECTS

- **Moim** (2025 – present): sole engineer, from build to deploy and monitoring, of a web, iOS and Android event app.
- **WiseBuy** (2023 – present): led a team of 5 and defined each role; luxury price comparison, ~400 visits a day.
- **Running Club MCP** (2026): Garmin running data as MCP tools for Claude. github.com/jw3329/run-mcp

SKILLS

AI: Claude API, MCP, tool use, agent orchestration, agent evals, prompt/context engineering, human-in-the-loop design
Languages: Python, Rust, TypeScript, Go, Java, SQL
Infrastructure: Kubernetes, Helm, AWS, Terraform, Docker, OpenTelemetry, Prometheus, Grafana, PostgreSQL

EDUCATION

University of Illinois Urbana-Champaign — B.S. in Computer Science and Mathematics — 2018
